EC HW2 - From a paper to a research niche

1. Neffke, Otto & Weyh (2017)	Neffke, Otto & Weyh (2017) try to answer the question of how industry-specific human capital is and which industries have similar human capital requirements. According to them, earlier works neglected mobility patterns of workers across industry boundaries. Their contribution lies in showing that there are in fact regularities in inter-industry labor flows.
2. Connected Papers	Landman et al. "*The role of relatedness and strategic linkages between domestic and MNE sectors in regional branching and resilience*" (2021) follows a similar approach in constructing the relatedness matrix, but for Ireland and additionally introducing the measures *weighted closeness* and *strategic closeness*. Their goal was to determine the impact of multinational enterprises on their host economy. Hane Weijman et el. "*How do occupational relatedness and complexity condition employment dynamics in periods of growth and recession?*" (2021) also follow the method developed by Neffke et al. (2017), but study occupational relatedness and complexity for local labor market areas in Sweden to determine how they relate to periods of growth and recession. Their findings include that increases in occupational relatedness are positively related to employment growth, while changes in occupational complexity have no significant impact as well as during recession specialization in more complex occupations was positively associated with employment growth.
3. Another Niche	Previous work has explained how skill-relatedness and labor mobility can explain economic developments on an industry- and/or firm-wide level. Mostly workers were not treated as individuals carrying distinct characteristics but conceptualized as units of labor. It is, however, important to include these distinct characteristics to understand inequalities in opportunities since most workforces are diverse.
4. Data Source & who could use the results	The ESS-Survey could be a viable data source since it contains information on distinct characteristics such as religion, gender, income and immigrant identity/background. The results of such a study could be relevant to policy makers, researchers interested in inequality or even companies that are trying to be more inclusive.
