EC2026 HW2

1. Summarize essay -- Neffke, Otto & Weyh (2017), Inter-industry labor flows （foucus on Research problem、What did earlier measures miss?、Research question、Contribution)

- Previous studies did not totally explain how workers move between the industries.
- Earlier methods looked at products、industry locations、or business links, but did not directly show how similar workers' skills are.
- The authors ask whether workers' job changes can reveal which industries require similar skills.
- They use German worker data to measure these links between the industries.
- They find that this method helps predict which industries can grow in a region better than earlier methods.

2. Find 2 journal articles published since 2020 that cite Neffke et al. (2017)

- Skills for Smart Specialisation: Relatedness, Complexity and Evaluation of Priorities、Buyukyazici (2023) -- This paper studies skills in different industries in Italy. It extends Neffke et al. (2017) by using detailed skills data instead of using only worker movements, and it shows how this can help regions choose there industries to support.
- The Dynamic Resilience of Urban Labour Networks、Feng, X. & Rutherford, A. (2023) -- This paper studies skill-related occupation networks in US cities. It extends earlier research on labour mobolity networks by using occupational skills and employment data to examine how technology and automation risks may spreading across jobs.

3. Formulate your own research niche

Recording on my HW1 about green, digital and twin industries in the UK, I want to study the role of shared skills.
Gap Statement -- Previous work has shown that related industries can help regions develop new activities, but we know less about how shared skills between digital and green jobs support green industry growth. This matters cuz workers with useful skills may help regions develop green industries more easily.
So the research question -- Do UK regions with more shared skills between digital and green jobs develop green industries more easily?

4. Name one data source that could answer your question, and who would use the answer (a company, a region, policy makers)

I would use ESCO data to compare the skills needed in digital and green jobs, together with UK regional employment data to study green industry growth
